Malaysian Communications and Multimedia Commission (MCMC) issues a new frequency band plan.

Stockholm, Sweden (PRWEB) November 2, 2006 -- The International 450 Association congratulates the Malaysian Communications and Multimedia Commission (MCMC) on the issuing of a new frequency band plan outlining requirements for the 452.000 - 456.475 MHz / 462.000 - 466.475 MHz (sub-band B) bands for the current NMT450 and future digital mobile systems. The use of these frequency bands is for mobile cellular services but may also be used for fixed wireless access or limited mobility services.

The channelization of the new frequency band plan is based on a 3 Carrier Channeling Plan, which is ideally suited to the use of CDMA450. MCMC does note that there is a proposal to introduce the 450-470MHz band as a part of the spectrum for the 3G/IMT2000 and that this proposal could have an affect on the way this band is channelized.

"The IA450 applauds MCMC/Malaysia for allocating the 450MHz frequency band with the capability to use one of the worlds most advance telecommunications technology, CDMA450. The technology is able to provide affordable voice/VOIP and high speed Internet services to the citizens of Malaysia, as has been proved in other markets throughout the world," said Safwan Zaheer, Chairman of Regulatory and Standards group within IA 450.

About IA450
The International 450 Association promotes the use of CDMA2000® in the 450MHz band (CDMA450), and supports industry standards to advance the deployment of the technology. IA450 brings together industrial members and operators from Africa, Asia, and Latin America and Europe. The IA450 provides guidance and leadership to operators interested in deploying CDMA450 technology through the extension of the results and benefits of actual member experiences and real life results and successes, to all global players. More information about the International 450 Association can be found on the IA450 Web site at www.450world.org.
